

# Acer ePerformance Management

Acer ePerformance Management offers you a simple-to-use tool to maximize your PC's performance.

Acer ePerformance Management enables you to optimize your PC's memory; check the memory usage to see if an upgrade is advised; optimize your HDD; and perform other functions to enhance the computer's boot up, shutdown and network performance.

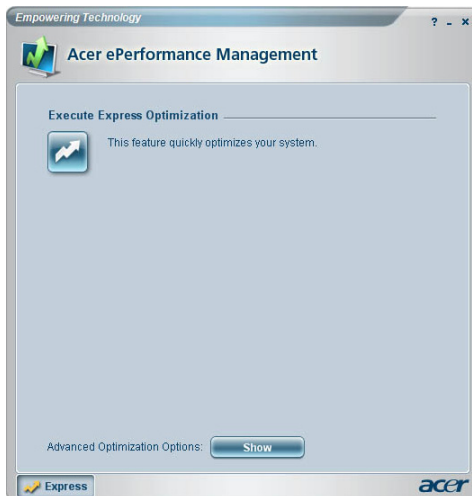

## Using Acer ePerformance Management

To launch Acer ePerformance Management:

- Click on Acer ePerformance Management icon in the **Empowering Technology** toolbar shown on your desktop.
- From the start menu, go to (All) Programs > Acer Empowering Technology > Acer ePerformance Management.

This will open the Acer ePerformance Management main page.

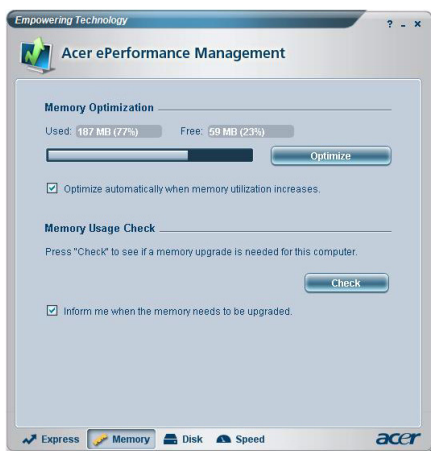

## Acer ePerformance Management Main Page

The Acer ePerformance Management main page allows you to **Execute Express Optimization**, to quickly put your system in top shape. Click **Show** to display advanced optimization options.

### Memory Optimization

After showing advanced optimization options, switch to the Memory page to view your system's current memory usage. You can instantly optimize memory by clicking **Optimize** or schedule memory to be automatically optimized when utilization increases.

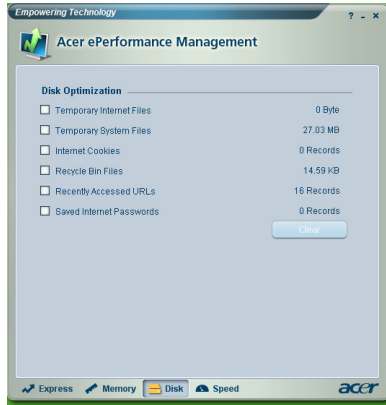

### Memory Usage Check

On the Memory page, you can also check if a memory upgrade is advised by clicking **Check**. For the most accurate results, check memory usage when your computer is in a normal working setting — checking just after boot up, for example, will not yield an accurate report.

## Disk Optimization

You can optimize your system's HDD performance by deleting files that are not needed. Select the file types from the list by checking the appropriate boxes, and click **Clear** to delete the files and free-up disk space.

## Speed Optimization

The five functions listed here serve to improve the overall performance of your computer.

- Turbo Startup: streamlines the startup process for faster booting.
- Turbo Shutdown: streamlines the shutdown process.
- Performance Enhancement: improves general performance.
- Disk Defragmentation: defragments the HDD while your computer is idle.
- Network Booster: improves network performance.
